

## Supa Smart Multi User Receiver

The SUPA range of receivers have been designed to provide a cost effective and simple way of organising a complex multi-user installation.

**SELF LEARNING:** The SUPA range uses self learning technology for adding transmitters to the system, making the installation quick and easy.

**SELECTIVELY ADD AND REMOVE USERS:** User transmitters can be very easily added and deleted from the system without affecting any other users already stored.

The system allows two methods to manage all the users:

- All users in a specific unit within the complex can be stored in a group. For easy identification the group number would correspond to the unit number.
- Each user has a unique group number, which must be recoded. This method allows 1500 users to be entered into the system

**3 CHANNEL FLEXIBILITY:** The system is supplied standard with 3 open collector output channels for greater flexibility and power. Each channel can be programmed to be latching (activate an alarm system or switch on perimeter lighting) or pulsed (operate a gate motor or similar access automation device). Any transmitter button can be programmed to operate any channel.

**SECURE DATA:** The programming console supports a plug in memory module, which is used to back-up all the information stored in the system.
